Introduction

Welcome to one of the easiest to use and maintain software services for both the affiliate and non-affiliate alike. The Domain Host d'Art (or DHd) was built from a proven affiliate software engine that I had created for my personal use. After years of tweaking it was time to share with everyone.

The software was created with a couple of key principles in mind. These principles are:

- Create a professionally looking website in a minimal amount of time;
- Require as little time as possible to keep the content current and interesting;
- Build in the ability to increase your SEO at every level of the website;
- Add in best of breed practices for speed, maintainability and robustness;
- Be unique, and
- Create a partnership with each and every subscriber.

There are many affiliates out there and success does not come over night. For many, affiliation is a struggle because they have to figure out HTML, CSS, Javascript, Hosting websites, XML Feeds, and how to do SEO right. The DHd service takes all of those concerns away and allows you to focus on what you are good at. Creating unique content and finding great products to affiliate. Some of the users have even shared the fact that creating affiliate websites were 'fun'.

Does this software automatically mean you will make money hand over fist? Of course not. It still takes some work for you to ensure that you build your brand by marketing it properly. But DHd does help to make that marketing task a lot easier. By removing the difficult and daunting technical aspects of affiliate marketing you have more time to post blogs highlighting your products, share links and promote your niche website.

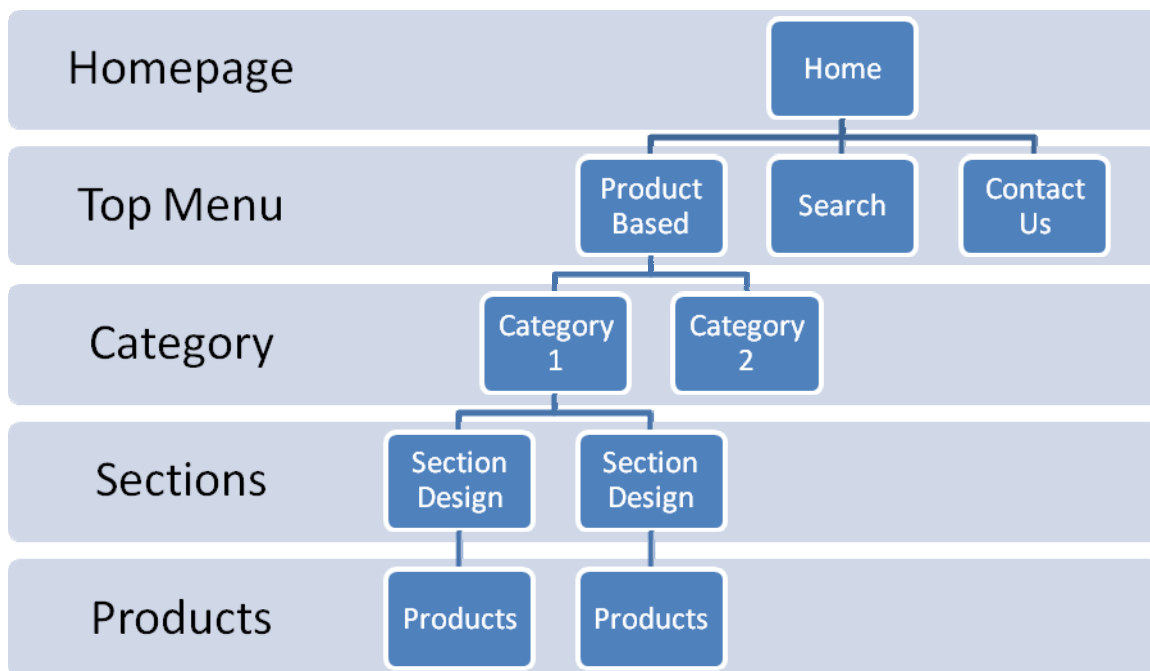

DHd places an array of functionality at your finger tips in a way that makes it easy for you. And the only purchase that you need to make is a domain name. That's it. Not a penny more. No hosting costs. No software costs. Nothing else. How do I afford this? My software will place my affiliate code on every 4th 'buy now' click of your shoppers. That is what I meant by our relationship being a partnership. We both share from our success.

What To Do First

You've gone ahead and requested your first Domain Host d'Art site. Great decision! But it seems almost daunting as to what you have to do first. Fear not. Your site will be ready for customers in minutes. Of course, if you want to grow and succeed a little bit of planning at this point is prudent. So let's do a bit of planning and then get into the setup of your site.

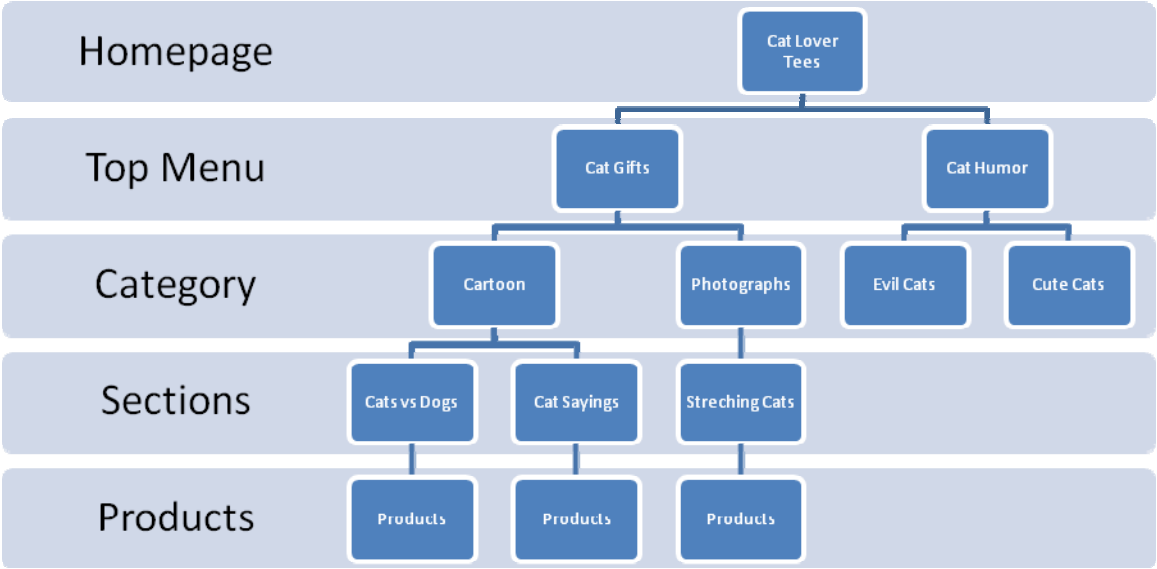

Pen and Paper Planning

I know, you want to get up and begin typing but let us think about the layout of your website for a moment. This will quickly become second nature to you but for now let us go over the basics. Your basic layout is as follows:

Perhaps a little example will help. Let us assume that we are creating a Niche website for Cats. Everybody loves cats, right? Well, maybe not dog lovers, but most people love cats. Those cat lovers, the crazy cat lady style cat lovers just love to buy t-shirts and gifts.

With a little bit of thinking you could create your website like this:

I skipped showing the Contact Us and Search page but you can see that you can use the Top Menu to breakdown your website into different sections.

So get a good layout for your Top Menu and Categories to ensure that you know how to switch up your site. The good news is that you can quickly and easily move things around as your site grows.

The next step is to think about how you want your products ordered.

Administration

Upon logging into your site's backend, you will be in the administration area of your site. This is where you will enter general site wide settings for your new website. When setting up your site, be sure you click on the *Save* button in the upper left corner of the workspace to save all your settings. You can return to this area to revise and update your settings at any time by clicking on *Admin* in the main menu.

By now you've decided on a name for your shop and you've determined whether you're setting up a store to sell your own products or to sell a combination of your products and affiliate products. Your choice will determine the type of information required and the options you select.

You will see several menu choices on the left hand side of the Admin area. Your *Store Basics* menu item should be highlighted. If not, click it now, and let's get started!

Store Basics

Store Basics

Website Info Tab

Website Name: This is where you enter the title of your website. It will display in the title bar at the top of the browser page and in your breadcrumb links. You can modify this at a later time without affecting existing inbound links that you may have acquired.

Email Address: Enter an email address that you check regularly. This email address will not be visible to site visitors. When a visitor contacts you via the form on the *Contact Us* page, this is the email address that the contact information will be sent to.

Are you an Affiliate?: [Affiliate] [Not an Affiliate] Your choice here will determine configuration of your site.

[Affiliate] If you're setting up your site as an affiliate site, first be sure that you are set up as an affiliate through the appropriate affiliate network/s. Then be sure to have your affiliate information handy. You will need to enter it on other tabs while doing your basic site setup. Once you are sure you are an affiliate and you have your affiliate information handy, select *Affiliate*.

[Not an Affiliate] If you're setting up your site for your own products only, select this option. If you're not ready for an affiliate site at this time, select this option. You can change it to the *Affiliate* option later when you are ready to add affiliate products to your site.

Website Mode: [Live] [In Progress] You can choose to keep your site hidden from view while you are getting your menus and products setup. Then, You can make it visible when you are ready for visitors.

[Live] This will make your shop visible to visitors.

[In Progress] Setting Mode to *In Progress* will hide all sections and display Search results on the first page. Great for when you are building your shop.

Enabled Rich Editing: [Enabled Rich Editing] [Raw HTML for Me!] Note that you will NOT lose any data by switching between the two options below.

[Enabled Rich Editing] The administration program has several areas where you can use a Rich Editor that provides easy-to-use functions for adding links and some formatting to your text. To use the Rich Editor, select this option.

[Raw HTML for Me!] If you're more the do-it-yourself type of person or would prefer to have a little more of a hands on approach with your site, you may wish to choose this option.

Enabled Blog: [Show Blog] [Hide Blog] DHd provides for hosting of a Wordpress blog for your site. The main purpose of your blog is to promote your DHd shop. Once your blog is setup, maintaining and updating your blog will be your responsibility. If you wish to have a blog for promoting your site, let us know and we'll get you set up.

[Show Blog] If you have requested a blog, have received your Wordpress login information and are ready to launch your blog, select this option. Enabling this will add a Top Menu tab that links to your blog. Choose this option ONLY if one has been setup for you.

[Hide Blog] If you do not wish to have a blog for your website, or until your requested blog has been set up, choose this option.

Blog Name: If we have set up a blog for you, enter the name of your blog here. This is the text that will be displayed on the Top Menu tab for your blog. You can change this at a later time if desired.

Cafepress Tab

Cafepress ID: If you are a Cafepress shop keeper you have already been assigned a unique Cafepress account number. That number is your Cafepress ID. If you're offering Cafepress affiliate products on your website, AND you will either feature your own products or your products could show up in search results from your site, your Cafepress ID number is required here to prevent 'double dipping'. To get your Cafepress ID, login to your Cafepress account and click on *Your Account* or *Your Shops* tab. You will see your Cafepress account ID in the upper right corner, under your email address. Once logged in, you can also find it [here](https://www.cafepress.com/cp/members/index.aspx) (https://www.cafepress.com/cp/members/index.aspx).

Cafepress API Key: This is your unique Cafepress API Key which is required in order for your site visitors to use the search function from within your site. To get your Cafepress API Key, first login to your Cafepress account. Once logged in to your account, your Cafepress API Key can be found here (<http://xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>).

Commission Junction Tab

This tab contains optional website setup information. If you're setting up your website for your own products only, then skip this tab. If you're setting up an affiliate site that will offer Cafepress affiliate

products, then you will need to provide your CJ PID for tracking purposes and to assure you get your affiliate commission from your sales.

CJ PID: This is your unique Commission Junction PID found in the administration area of your Commission Junction account. Login to Commission Junction, click on *Account* then go to the *Web Site Settings* tab. Click on *Add a new website* to enter your new website information for improved tracking, or select an existing website from the *Select Web site* dropdown box. Copy your PID for the appropriate site and paste or type it into this CJ PID box. **IMPORTANT** - This is NOT your account number displayed in the upper right corner of your Commission Junction account pages.

CJ SID: If you would like a word or term that will help you identify CJ affiliate sales made from your website, you have the option to enter it here. This is an identifier that you create.

Mechanics Tab

Default Redirect: [Marketplace] [Shop] This is a site wide setting indicating where your visitors are to be directed to when they click on the *Buy Now* button.

[Marketplace] This is the suggested setting to use if you are setting up an affiliate site. Using this setting will help reduce 'leaks' where Cafepress shops may be redirecting offsite to other domains, or may have links in their shop to other online shopping venues which do not offer you commission.

[Shop] This is the suggested setting if you are setting up a website to display your own products only.

Default Search Query: The Default Search Query is used for populating the right sidebar on your site's Home page, with products resulting from a Cafepress marketplace search. When the system cannot determine what search criteria to use, it will use this Default Search Query. This feature gives the Home page of your site fresh content, which search engines and shoppers like. Try using a generic version of your niche OR, if setting up your shop for your products only, then your unique Cafepress image tag is perfect. You can use AND or ORs and NOTs but it is best to keep the search term as simple as possible.

SEO Tab

Default Meta Keywords: This is placed in the underlying <head> HTML code of your webpage. It is used as part of SEO and should be 5-10 relevant key phrases.

Default Meta Description: This is placed in the underlying <head> HTML code of your webpage. It is used as part of SEO but more importantly is utilized as the description blurb for Google and other search engines. This default description will be used when the system cannot determine what criteria to use. This should be written for human consumption with SEO rich words and should not be longer than 150 characters.

Tracking Tab

Search Engine Validation: Search engines like Google and Yahoo need you to prove that you own your site in order to permit you to gain access to their statistics. Use this field to put in their provided metadata code. If you have your own CSS files for your site, you can also insert your CSS code here for use in your section headers.

Statistical Counter Code: Place your website counter code here. Counter images, if included in the code will appear at the bottom of your pages in the footer. Invisible counter codes are best.

My Stores

If you are a Cafepress shop keeper and have relevant products in your shop/s that you will be offering in your website or your own products could show in the sidebar or searches from your site, you should add those shop names here. Adding your Cafepress shops here will ensure that your shopping cart redirects customers to your shop/s for your products, instead of to the marketplace, so that you will get a 'shop' sale. Not adding your Cafepress shops here could impact the revenue you are paid on your own product sales and your volume bonus. To add your shop/s, click the *Add New Store* button, and enter your Cafepress Shop ID (as it appears in the Cafepress URL) for the Store Name. Click the Save button to save your shop. Repeat for additional Cafepress shops

Clear Cache

This feature allows you to clear your site's cache if you are seeing weird errors in your site after Cafepress maintenance or downtime. Note that clicking on the *Clear Cache* menu option will clear all saved or cached content.

Reports

[Click thru's like on buy now?](#)

Click Report

Product Type Report

Feeds & Maps

This section lets you create a sitemap for search engines. Whenever you make significant changes to your site, return here and click *Create Sitemap* to update your sitemap for the search engines.

Sitemap Tab

To create a sitemap file for your website, click Create Sitemap. You will then see a URL giving you the location of your sitemap should you need that information for Google or other services. You also have the option of downloading your sitemap to your own computer.

Google Product Feed Tab

This feature is under development.

Merchandise

You have entered all your basic store information under *Admin* and now you are ready to decide how you want your products organized in your new store. Here in the *Merchandise* area you will find several features that let you not only choose which products you display in your store and which remain hidden, but also create your own product titles and product descriptions. You can also create product sets or groupings, choose the order of those groupings and choose which products appear in which group and in what order.

By having this much control over your products, you can create a store that is unique and does not duplicate content of any other site or store. That uniqueness makes your store stand out, not only to shoppers but to search engines as well.

As you work through setting up and organizing your products, you will more than likely move back and forth between *List Groups* and *List Product Types* in the left hand menu. When your site was activated, it was pre-populated with some default product groups for you. Let's take a look at those groups.

Groupings

List Groups

When you click on *List Groups* you will see a list of your existing product sets or groups. They are listed in the order in which they will appear in your store, on your product and search results pages. You can place your product groups in any order by clicking and dragging them into place. When done, click on *Save* to save your order. The order you see here is the order they will be in when merchandise is displayed in your store.

Not Displayed – At the bottom of your Group List is a group titled *Not Displayed*. This is the group that will contain any products you do not wish to offer in your store. Suppose you want a store with only t-shirts. You can assign all non-t-shirt products to this group. Those and any other product assigned to the *Not Displayed* group will not be visible in your store's merchandise pages, search results or sidebar widgets. If you have an affiliate site, you can place the few products that you do not get an affiliate commission for into this group. You can, also, use this group for products which are out of stock for an extended period of time, too, adding them back when that product type is available. Products assigned to *Not Displayed* will still be displayed if existing incoming links to them are clicked.

The display for each product group shows the group's Name, Description, an *Edit Group* button and a *Delete Group* button. Clicking on these buttons lets you preform task specific to a particular group.

Edit Group: Clicking on the *Edit Group* button lets you change a group's Name, Sort Order*, and Description. And if you need a little help, click on the *Help* button for a little more information.

*Sort Order is more easily changed in the Group List by clicking, dragging and saving.

Delete Group: You have the option of deleting a product group with this button. You cannot delete a product group that has products associate with it, so if your product group has products assigned to it you will first have to delete them or assign them to a different group.

Add New Group

No doubt you will be adding a new product group or two. When you click on *Add New Group* you will get a window for filling in the new group's Name, Sort Order and Description. If you need additional information, click the *Help* button at the top of the window. And be sure to *Save* your new group when done.

Group Information: In the Group Information box you will need to give your new group a name. Type that in the Name box here. (I would like to say something about the length or number of characters permitted for the name.) This is the group title that will be displayed on your product and search results pages. You can also set your Sort Order here. If you leave the Sort Order set at the default, 99, once saved new group will be placed at the bottom of the Group List. Again, like when editing an existing group, it is much easier to click and drag your group into the preferred position in the Group List.

Group SEO: Here you will enter a brief (150 character) description for your group. This description is not displayed on your site, but is used for SEO as alt tags.

Product Types

List Product Types

The *List Product Types* option shows a listing of all your products organized into their respective groups, including products that are not displayed. Here you can edit and arrange your products.

The products within each group are shown in the order they will be displayed in to your site visitors. To change the order of products within a group, just click and drag them into the preferred order. You can set your order when you edit your product types, but this is the easiest and preferred way of changing your product sort order. Be sure to click *Save Order* when you have your products in the order you want. Though it may look like you can move products from group to group here, you cannot do that here.

To change the group assignment of a product, click the *Edit* button. The next screen will give you access to the product's group assignment, Name, URL, Description and a place to add SEO keywords for that product. When you click the *Edit* button you will see the following tabs:

Product Info Tab

Name: This is the product name used for searches and for your keywords/SEO. It is initially set to what Cafepress provides and likely should be kept as that. But, if you choose to make a change to it, like changing "T-shirt (dark)" to "Dark T-shirt", it is best done while setting your shop up initially or when moving a new product into the lineup. Since the product Name is part of the products URL, any changes to the product's Name will affect existing inbound links, causing 401 "not found" errors when those existing links are clicked. Once products are 'live' in your store, as a rule, you do not want to make any changes to the product Name.

Product URL: This URL will be used as part of the URL address when a user is searching for a specific product type. It should be SEO friendly. It will be converted to a URL friendly address upon saving. Just

like the product Name, it should only be changed at initial setup or when introducing new product types to your store.

Group: This lets you select or change, via a dropdown list, which product group a particular product type will be assigned to. If you don't want the product to show up in your store's searches, sections or on the front page, choose Not Displayed

SEO Tab

Keywords: Keywords added here are for SEO purposes. These keywords and phrases are site wide and will be used as metatag keywords for product pages. Be sure to use variations like "t-shirt", "shirt" "tee", etc.

Description: Here is one of the unique features of the DHd software that gives you added control over your site's content. You have the ability to write your own creative, SEO-friendly, keyword-rich product descriptions. Instead of using the default CafePress product description provided, you can write product descriptions that are more specifically tuned to the interests of your store shoppers. Be verbose, tell a story. This feature will help you build a site that presents unique content to your shoppers and search engines, alike. Your site will stand out to your customers and can entice them to buy. Your product descriptions will appear on the product pages with any merchandise matching this product type. We recommend that you spend a little extra time on this feature; it is worth it.

Add New Product Types – Click *Add New Product Types* to install products that have been added to cafePress since your store was setup. When clicked, the action is automatically performed and the most recent additions to the CafePress lineup are added to your list of product types. You will find these new products in the Not Displayed group. You will then select and edit the Product Information and SEO for any products you wish to add to your store.

Templating

At any time during the process of setting up or maintaining your website, you can click on *Templating* to customize the look and feel of your new online store. This area highlights a number of the exciting features of the DHd software.

The templating features built right in to your DHd software eliminate many of the hassles of creating a solid layout and appealing color scheme for your website. If you know little to nothing about building web pages, or just want to quickly launch an attractive and functional online store, you'll really appreciate the ease and speed with which you can build your site. And, if you're a store owner who doesn't want to be held in by pre-determined choices, the DHd software permits you to upload your files that override the built-in HTML and CSS. Here, with just a few clicks, you can completely customize the layout and look of your store, and do it with ease.

Template Overview

The Template Overview shows your Welcome Page Options. Your Welcome Page is the first page, or home page, of your store. Here you can view or edit what your site visitors will see when they enter your store through your home page. Remember, after making any templating changes, to *Save* your work.

Widgets

The modular interface of DHd lets you control what appears in your store through the use of drag and drop widgets. There are widgets for displaying elements such as your Main Navigation Menu, Search Bar, and Search Filter, to name a few.

You can choose which widgets display to your visitors and which ones remain hidden. Your widget placement will ultimately be determined by the store layout you choose, whether you want a layout with one or two sidebars. However, you can quickly add, move or remove a widget at any time. For example, if you decide to move your navigation menu from one side of the page to the other, or to remove the CafePress coupon or other feature, you can do it with a few quick mouse clicks.

To put your widgets in your sidebar/s, just click, drag and drop them into place. You can place them in any order and that will be the order in which they are displayed in your store. Any widget in the 'Not In Use' area will not be displayed on your site. Please note, if you have chosen a shop layout with a single sidebar, only widgets placed in 'Left Sidebar' will be displayed, even if that sidebar is on the right hand side of your layout. Also, in a two sidebar setup, the second sidebar will not be displayed on Product Detail, Search and Contact Us type pages.

Basic

When you click on *Basic* you will see your Welcome Page Options. You can review or change any of your welcome or home page settings here.

Welcome Page Options Box

Display Type: [Clicked Products] [Recently Added Products] [No Products] Here you choose the type of information you want to appear in the Content area of the front page of your website.

[Clicked Products] This option will populate the Content area of your welcome page with products that have been clicked on by your site visitors.

[Recently Added Products] Choose this option to display the products you have most recently added to your store.

[No Products] If you choose to display no products, of course, no products will show up on the welcome page. You can use this option if you have your own content for your home page. You will place that content in the Welcome Page HTML section below for a customized home page.

Display Rows: [1] [2] [3] [4] [5] [10] [15] [20]

[#] If you choose to show products on your home page, this sets the number of products that will be displayed.

Template Type: [Basic Template] [Advanced Template]

[Basic Template] Choose this option if you want to primarily use the modular features of the DHd software for your site.

[Advanced Template] This option will alert the software that you wish to override built-in HTML and CSS features.

Welcome Page HTML: Type in any text and HTML that you want displayed in the content area on your home page. If you have chosen to display products on your welcome page, this text will appear above them as an introduction. If you have chosen to display 'No Products', this text will be all that shows in the main content area of your home page.

Layout

Your choices in Layout determine the column placement for your store. Simple radio buttons let you choose the placement of your main content and sidebar/s. In your store's layout, Content is your main product area, Sidebar 1 is your side navigation menu, and Sidebar 2 is the keyword search display box.

Again, please note that if you choose a shop layout with only one sidebar, only the widgets placed in 'Left Sidebar' (S1) will be displayed. Also, if you choose to display two sidebars, the second sidebar (S2) will not be displayed on Product Detail, Search and Contact Us type pages. This can be helpful if your mpSearch widget resides in S2; when Cafepress is down you can temporarily remove the second sidebar so that keyword search products do not show up in error.

Layout Box

Column Structure: You can choose whether your main content is down the center or on the right or left hand side of your store's pages. A simple click lets you choose the position of your main content in

relation to your sidebar/s, and to choose whether you show one or more sidebars. For each choice you will see a graphic representation of what that layout looks like. Just click the button of your choice for your preferred layout. Any time you wish to modify your layout, this is where you will make those changes.

Header

Header lets you decide how you want the header of each of your store's pages to look. You can choose to display only the Website Name or you can upload your own header image. This is handy; your site name will display unless or until you upload a header image.

Website Header Box

If you have your own header image for your store, you can choose whether or not to display it, and if shown, you can choose how it is displayed. If you have already uploaded your header file, you will see it displayed in this box.

Use Custom Header Image?: [No] [Yes]

[No] If you select No, your header for all your store's pages will display your Website Name, which you entered when you setup your shop using the features in *Admin*.

[Yes] Choose Yes if you have a header image of your own that you would like to use for your site.

Header Repeat: [Repeat] [Repeat X] [Repeat Y] [No Repeat]

[Repeat] Header image will repeat both horizontally and vertically

[Repeat X] Header image will repeat horizontally

[Repeat Y] Header image will repeat vertically

[No Repeat] Header image will not repeat

Upload New Header Box

Specify location of Header File: Type in or browse for the location of your header image file. Then click the *Upload* button to upload your file.

Header Buttons

For further customization of your store, you can choose the 'customer service' links you would like displayed in your header bar, and the order in which they are displayed. Drag & Drop the Header Buttons you want to show from 'Not In Use' to 'Header Bar'. The order of the Header Buttons from top to bottom is the order they will be displayed in from left to right on the website.

Top Menu

Basic Template Options Box

Menu Type: If you are using Basic templating, you can choose how you would like your top menu to appear. There are several styles shown from which you can choose. Just select the radio button associated with your choice of style and click *Save* to preserve your choice.

Side Menu

Basic Template Options Box

Menu Type: Again, if using Basic templating, there are several side menu choices that are already built-in. Your choice here will determine the look of your Main Menu widget. Select your menu style and *Save* your preference.

Footer

The Basic templating for the Footer is just like that of the Header. You can upload a footer image for your site here.

Website Footer Box

If you have your own footer image for your store, you can choose whether or not to display it. If shown, you can choose how you would like it to be displayed. If you have uploaded your own footer image file, you will see it displayed here.

Use Custom Footer Image?: [No] [Yes]

[No] If you do not have your own footer image, then select No.

[Yes] Choose Yes if you have a footer image of your own that you would like displayed at the bottom of your site's pages.

Footer Repeat: [Repeat] [Repeat X] [Repeat Y] [No Repeat]

[Repeat] Footer image will repeat both horizontally and vertically

[Repeat X] Footer image will repeat horizontally

[Repeat Y] Footer image will repeat vertically

[No Repeat] Footer image will not repeat

Upload New Footer Box

Specify location of Footer File: Type in or browse for the location of your footer image file. Then click the *Upload* button to upload your file.

Color Scheme

Setting up a color scheme for your site is now fun and exciting and can be done with the simple click of a mouse. There are well over 50 pre-built coordinated color schemes available for you to choose from. You can set the entire tone of your visitor's experience by choosing from one of the built-in schemes. If you want further customization you can fine tune an existing color scheme, element by element, or plug in your own color codes for even more control.

For color selection at its simplest, let's skip down to the Prebuilt Schemes Box and then we'll return to the Layout Colors Box.

Prebuilt Schemes Box

Color Options: You will first want to choose a color scheme from the Prebuilt Schemes Box. Find a color selection that is right for your site, and click the corresponding radio button to select; then click *Save*. Once a color scheme has been selected and saved, your site will immediately show the changes. You can see a preview of the changes at the top of the page or by previewing your site in your browser. If you want further customization, you can return to the Layout Colors Box to fine tune most of the elements of your layout.

Layout Colors Box

For each design element shown in the Layout Color Box, you will see both the Scheme Color and the Custom Color along with the corresponding HTML code for each. If you have made no changes to the selected color scheme, both colors represented will be the same.

To change a particular design element's color to your own custom color, click in the box under Custom Color for that element; a color picker will pop up. Here you can use the slider and window to select a color or type in your custom color code if you know it. Click OK to enter your choice and close the color picker. You can either change other elements in the same fashion, or *Save* your custom color choice now and preview the results.

Below are brief descriptions of how your color scheme affects the design elements.

Background: This is the major element that sets the tone of your website.

Header Color: This is your Header Color. It is initially set to the same as the background but changing it can give a dramatic change to your page.

Highlight Color: Sidebars and other highlighted content will use this color.

Font Color: This is your primary font color. It will be used in your content area and sidebars.

Highlight Font Color: This is your highlight font color. It will be used for your shop name, active menus and other areas that require a contrast.

Menu Color: This is your base menu color. Not all menus accept color changes.

Content Area Color: This is your content area color. This should be a light color or kept as white.
